This book will enable readers to: Detail the rationale for using perioperative hemodynamic monitoring systems and for applying goal directed therapy protocols at the bedside. Understand the physiological concepts underlying perioperative goal directed therapy for hemodynamic management. Evaluate hemodynamic monitoring systems in clinical practice.

Hemodynamic monitoring is the cornerstone of perioperative anesthetic monitoring. In the unconscious patient, hemodynamic monitoring not only provides information relating to cardiac output, volume status and ultimately tissue perfusion, but also indicates depth of anesthesia and adequacy of pain control.

BACKGROUND: In this study, our objective was to determine whether a perioperative hemodynamic protocol based on noninvasive cardiac output monitoring decreases the incidence of postoperative complications and hospital length of stay in major abdominal surgery patients requiring intensive care unit admission.

This specialized book on perioperative haemodynamic monitoring and goal-directed therapy is edited by two renowned experts in the field, and the contributors are mainly from Europe and the USA. The book attempts to address the philosophy that haemodynamic monitoring by itself is of no use and that the haemodynamic information should be used for the patient's benefit. The main theme and focus ...

The automation of perioperative hemodynamic management is difficult to envision. Most goal-directed therapy protocols recommend stopping fluid boluses if they do not increase stroke volume (non-responder patients), but truly hypovolemic patients may not respond to a fluid bolus by an increase in stroke volume if they are bleeding at the same time.
