Probability = the number of ways of achieving success the total number of possible outcomes For example, the probability of flipping a coin and it being heads is  $\frac{1}{2}$ , because there is 1 way of getting a head and the total number of possible outcomes is 2 (a head or tail). We write  $P(\text{heads}) = \frac{1}{2}$ .

The mathematics field of probability has its own rules, definitions, and laws, which you can use to find the probability of outcomes, events, or combinations of outcomes and events. To determine probability, you need to add or subtract, multiply or divide the probabilities of the original outcomes and events. You use some combinations so often that they have their own rules and formulas.

Probability does not tell us exactly what will happen, it is just a guide Example: toss a coin 100 times, how many Heads will come up? Probability says that heads have a  $\frac{1}{2}$  chance, so we can expect 50 Heads. But when we actually try it we might get 48 heads, or 55 heads... or anything really, but in most cases it will be a number near 50.
